SOME FINITENESS CONDITIONS IN LATTICES –
USING NONSTANDARD PROOF METHODS

MATT INSALL

In [1], the notion of a *local join (meet) endomorphism* of a lattice was defined. This notion, though interesting in the context of infinitary lattice operations, is redundant in the finitary setting, so its removal from all hypotheses does not affect the results presented therein. The author regrets this oversight and wishes to thank those readers who are patient enough to read over this error.
