The authors regret the inclusion of a coding error in “The New Keynesian Wage Phillips Curve”. The composite inflation measure was correctly defined in the paper as

$$\Pi_t^c \equiv \left(\Pi_t^p \right)^\vartheta \left(\Pi_t^w \right)^{1-\vartheta}, \quad (5.6)$$

where the weight $\vartheta \equiv \Lambda_p / (\Lambda_p + \Lambda_w)$ is given by the relative slopes of the linearized Price and Wage Phillips Curves, Λ_p and Λ_w , respectively. However, the computer code had switched the exponents and instead used

$$\Pi_t^c \equiv \left(\Pi_t^p \right)^{1-\vartheta} \left(\Pi_t^w \right)^\vartheta. \quad (5.6')$$

Instead of putting an 85% weight on price inflation, only 15% was put on it. This mistake leaves the qualitative results of the paper unaffected. Quantitatively, the correction moves the numerical results for the composite case in Tables 4 to 6 closer to the inflation targeting case. The corrected tables are provided below.

*We are grateful to Juan Paez-Farrell for making us aware of the error.
