

ANALYTIC CAPACITY FOR TWO SEGMENTS

TAKAFUMI MURAI

§1. Introduction

The analytic capacity $\gamma(E)$ of a compact set E in the complex plane \mathbb{C} is defined by $\gamma(E) = \sup |f'(\infty)|$, where $-f'(\infty)$ is the $1/z$ -coefficient of $f(\zeta)$ at infinity and the supremum is taken over all bounded analytic functions $f(\zeta)$ outside E with supremum norm less than or equal to 1. Analytic capacity $\gamma(\cdot)$ plays various important roles in the theory of bounded analytic functions.

It is known that $\gamma(E) \leq |E|$, where $|\cdot|$ is the (generalized) length (i.e., the 1-dimension Hausdorff measure [3, CHAP. III]) and that the inverse relation does not exist, in general. In fact, Vitushkin [14] constructs an example of a set with positive length but zero analytic capacity, and Garnett [3, p. 87] also points out that the planar Cantor set with ratio $1/4$

$$E(1/4) = \bigcap_{n=0}^{\infty} E_n$$

satisfies the same property. Here E_0 is the unit square $[0, 1] \times [0, 1]$ and E_n is inductively defined from E_{n-1} with each square Q of E_{n-1} replaced by four squares with sides 4^{-n} in the four corners of Q . The set E_n is a union of 4^n squares with sides 4^{-n} , and the projections of these 4^n squares to the line $\mathcal{L}: y = x/2$ do not mutually overlap. Hence if we choose \mathcal{L} as a new axis, then E_n seems like a discontinuous graph. From this point of view, the author [8, CHAP. III] defined cranks and studied their analytic capacities: Cranks are nothing but deformations of sets of Vitushkin-Garnett type, however, these discontinuous graphs simplify the computation of analytic capacity and enable us to construct various examples [8, Theorem F], [9]. Hence clarifying the geometric meaning of cranks is important and would be applicable to study analytic capacities of general sets. (Crank is closely related to fractals (Mandelbrot [6]).)

Received April 21, 1989.

Here are simple cranks of degree 1:

$$\Gamma(1 + iy) = [-1/2, 1/2] \cup (1 + iy + [-1/2, 1/2]) \quad (y > 0).$$

This is a subclass of

$$\Gamma(z) = [-1/2, 1/2] \cup (z + [-1/2, 1/2]) \quad (z \in \mathbf{C}),$$

where, in general, $(z + wE) = \{z + w\zeta; \zeta \in E\}$ ($z, w \in \mathbf{C}; E \subset \mathbf{C}$). The purpose of this note is to study $\gamma(z) = \gamma(\Gamma(z))$ ($z \in \mathbf{C}$) and show a role of cranks $\Gamma(1 + iy)$ ($y > 0$) in an extremum problem.

In fluid dynamics, $\Gamma(z)$ is a model of biplane wing sections, and the study of flows obstructed by $\Gamma(z)$ is classical (Ferrari [1], Garrick [3]). As is well known, there exists uniquely an analytic function $f_z(\zeta)$ outside $\Gamma(z)$ such that

- (1) $f_z(\zeta)$ is integrable on $\partial\Gamma(z)^n$ (with respect to the length element $|d\zeta|$), $f_z(\zeta)$ is real-valued continuous on $\partial\Gamma(z)$ and $f_z(\infty) = -i$,
- (2) $|f_z(p)|$ exists at the right endpoint p of each component of $\Gamma(z)$ (Joukowski's hypothesis).

Here $\partial\Gamma(z)$ is the subboundary of $\Gamma(z)^c$ which corresponds to $\Gamma(z)$ -{endpoints of $\Gamma(z)$ } topologically; $\partial\Gamma(z)$ has two sides. Condition (1) means that $f_z(\zeta)$ is a velocity field obstructed by $\Gamma(z)$ with velocity i at infinity, and (2) means that vortexes at endpoints of $\Gamma(z)$ are negligible. We define the lift coefficient for $\Gamma(z)$ by

$$\mathcal{L}(z) = \frac{1}{4} \left| \frac{1}{2\pi} \int_{\partial\Gamma(z)} f_z(\zeta)^2 d\zeta \right| \left(= \frac{1}{2} |f'_z(\infty)| \right).$$

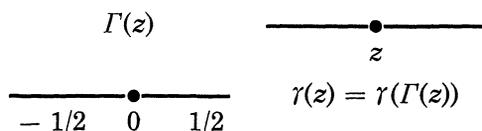

Using Blasius' theorem [7, p. 173], Kutta-Joukowski shows that $4\pi\mathcal{L}(z) \sin \alpha$ gives the lift for $\Gamma(z)$ with respect to the velocity field with density 1 and velocity $e^{i\alpha}$ at infinity ($0 \leq \alpha \leq 2\pi$) (cf. [7, CHAP. VII], [3]). In the section 2, we shall give a formula for $\gamma(z)$ in terms of $\mathcal{L}(z)$ and shall show that $\mathcal{L}(z) \leq \gamma(z)$ (Theorems 1 and 2). To compute $\gamma(z)$ practically, it is necessary to study the so-called modulus-invariant arcs. In the section 2, we shall show two lemmas (with respect to modulus-invariant arcs) which will be used later. Using our formula along modulus-invariant arcs, we shall show, in the section 4, that the behaviour of $\gamma(z)$ near 1 is critical (Theorem 8). In the section 5, we shall show that

$$\sigma_0 = \min_{y \geq 0} \gamma(1 + iy) / \gamma(1),$$

where σ_0 is defined by the infimum of $\gamma(x + iy) / \gamma(x)$ over all real numbers

ⁿ The condition " $\lim_{\epsilon \rightarrow 0} \int_{|\zeta-p|=\epsilon} |f_z| |d\zeta| = 0$ ($p = \pm 1/2, z \neq \pm 1/2$)" is required.

x and y (Theorem 13). Since $\gamma(z) = 1/2$, $2\sigma_0$ equals the minimum of analytic capacities of cranks $\Gamma(1 + iy)$ ($y > 0$). This shows that the computation of $\gamma(1 + iy)$ ($y > 0$) is essential in this extremum problem. We shall also show a practical method to estimate σ_0 . Theorem 13 suggests that $E(1/4)$ is an extreme in a sense. Our method works for unions of two segments with different length, however, this is not applicable to unions of three segments.

§ 2. A formula for $\gamma(z)$

In this section, we give a formula for $\gamma(z)$ ($z \in \mathbb{C}$). Without loss of generality, we may assume that z is contained in $P = \{\zeta \in \mathbb{C}; \text{Re } \zeta \geq 0, \text{Im } \zeta \geq 0\}$, where $\text{Re } \zeta$ and $\text{Im } \zeta$ are the real part and the imaginary part of ζ , respectively. A domain $\Gamma(z)^c$ is univalently mapped onto a ring $\{\zeta \in \mathbb{C}; r < |\zeta| < r'\}$. The modulus of $\Gamma(z)^c$ is defined by $\text{mod}(\Gamma(z)^c) = r'/r$ [12, p. 199]. An arc λ in P is called modulus-invariant, if $\text{mod}(\Gamma(z)^c)$ is a constant on λ . For $z \in P$, $\text{Im } z > 0$, $\lambda(z)$ denotes the modulus-invariant arc in P with endpoints z and a real number; this real number is uniquely determined by z and larger than 1. In this section, we show the following two theorems.

THEOREM 1. For $z \in P$, $\text{Im } z > 0$,

$$(3) \quad \gamma(z) = \frac{1}{2} + \frac{\text{Im } z}{2} \int_{\lambda(z)} \left\{ \frac{\gamma(\zeta)}{\mathcal{L}(\zeta)} - 1 \right\} \frac{d(\text{Im } \zeta)}{(\text{Im } \zeta)^2},$$

where z is chosen as the initial point of this curvilinear integral.

THEOREM 2. $\mathcal{L}(z) \leq \gamma(z)$ ($z \in P$). Equality holds if and only if z is real.

Since z is the initial point of the integral in (3), Theorems 1 and 2 show that $\gamma(z) < 1/2$ ($z \in P$, $\text{Im } z > 0$). Here are some lemmas necessary for the proof. The following lemma is a version of biplane theory to analytic capacity (Ferrari [1], Garrick [3], Sasaki [13, pp. 208–213]).

LEMMA 3. For $0 < k < 1$ and $t \geq 0$, we define

$$(4) \quad \xi_k(t) = \left[\frac{2m_k^2 + (1+k^2)t^2 - \sqrt{\{2m_k^2 + (1+k^2)t^2\}^2 - 4(1+k^2t^2)(m_k^4 + t^2)}}{2(1+k^2t^2)} \right]^{1/2},$$

$$(5) \quad \eta_k(t) = \left[\frac{2m_k^2 + (1+k^2)t^2 + \sqrt{\{2m_k^2 + (1+k^2)t^2\}^2 - 4(1+k^2t^2)(m_k^4 + t^2)}}{2(1+k^2t^2)} \right]^{1/2},$$

$$l_k(t) = \tau_k + \int_0^t \{\eta_k(s) - \xi_k(s)\} ds,$$

where

$$m_k = \frac{1}{k} \sqrt{\frac{E(k')}{K(k')}}, \quad \tau_k = 2 \int_1^{m_k} \frac{m_k^2 - s^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2s^2}} ds,$$

$$E(k') = \int_0^1 \sqrt{\frac{1 - k'^2s^2}{1 - s^2}} ds, \quad K(k') = \int_0^1 \frac{ds}{\sqrt{1 - s^2} \sqrt{1 - k'^2s^2}}, \quad k' = \sqrt{1 - k^2}.$$

Let

$$\begin{aligned} z_k(t) &= x_k(t) + iy_k(t) \\ &= 1 + \left\{ -\tau_k + 2 \int_0^t \xi_k(s) ds + \frac{i\pi}{k^2 K(k')} \right\} / l_k(t). \end{aligned}$$

Then

$$(6) \quad \gamma(z_k(t)) = \left\{ \frac{1 - k}{2k} \sqrt{t^2 + k^{-2}} \right\} / l_k(t).$$

Proof. Since this lemma plays an important role in the proof of Theorems 1 and 2, we give the proof of this lemma, for the sake of completeness. For $0 < k < 1$ and $t \geq 0$, we write $\xi = \xi_k(t)$ and $\eta = \eta_k(t)$. Take a Schwarz-Christoffel transformation

$$f(\zeta) = \int_0^\zeta \frac{s^2 - m_k^2}{\sqrt{s-1} \sqrt{s+1} \sqrt{ks-1} \sqrt{ks+1}} ds - it\zeta,$$

where we choose a branch of the square root so that the upper half plane is mapped to the positive orthant. Since

$$m_k^2 = \int_1^{1/k} \frac{s^2 ds}{\sqrt{s^2 - 1} \sqrt{1 - k^2s^2}} / \int_1^{1/k} \frac{ds}{\sqrt{s^2 - 1} \sqrt{1 - k^2s^2}}.$$

$f(\zeta)$ univalently maps $\{[-1/k, -1] \cup [1, 1/k]\}^c$ onto $\{(-a + i[\alpha_-, \beta_-]) \cup (a + i[\alpha_+, \beta_+])\}^c$ for some $a > 0$, $\alpha_\pm < \beta_\pm$. (See [13, pp. 208-213].) Pommerenke [11] shows that $\gamma(E) = |E|/4$ if E is a compact set on the real line. Since

$$\lim_{\zeta \rightarrow \infty} f(\zeta)/\zeta = (1/k) - it,$$

the conformal invariance of $\gamma(\cdot)$ and Pommerenke's theorem show that

$$\begin{aligned} & \gamma((-a + i[\alpha_-, \beta_-]) \cup (a + i[\alpha_+, \beta_+])) \\ &= \left| \frac{1}{k} - it \right| \gamma([-1/k, -1] \cup [1, 1/k]) = \frac{1-k}{2k} \sqrt{t^2 + k^{-2}}. \end{aligned}$$

Legendre's formula

$$E(k)K(k') + E(k')K(k) - K(k)K(k') = \pi/2 \quad [4, \text{p. 291}]$$

shows that

$$2a = 2 \operatorname{Re} f(1) = 2 \int_0^1 \frac{m_k^2 - s^2}{\sqrt{1-s^2} \sqrt{1-k^2s^2}} ds = \frac{\pi}{k^2 K(k')}.$$

Let

$$\psi_k(x) = \int_1^x \frac{m_k^2 - s^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2s^2}} ds \quad (1 \leq x \leq 1/k).$$

Then (4) and (5) show that

$$1 < \xi < m_k, \quad \psi'_k(\xi) = t; \quad m_k < \eta < 1/k, \quad \psi'_k(\eta) = -t.$$

These inequalities yield that

$$\beta_+ = \psi_k(\xi) - t\xi, \quad \alpha_+ = -\psi_k(\eta) - t\eta, \quad \alpha_- = -\beta_+,$$

and hence

$$\begin{aligned} \beta_+ - \alpha_+ &= \psi_k(\eta) + \psi_k(\xi) + t(\eta - \xi), \\ \alpha_- - \beta_+ &= 2t\xi - 2\psi_k(\xi). \end{aligned}$$

Rotating, translating and normalizing $(-a + i[\alpha_-, \beta_-]) \cup (a + i[\alpha_+, \beta_+])$, we obtain

$$\begin{aligned} \gamma(z_k^*(t)) &= \frac{1-k}{2k} \sqrt{t^2 + k^{-2}} \frac{1}{\psi_k(\eta) + \psi_k(\xi) + t(\eta - \xi)}, \\ z_k^*(t) &= 1 + \frac{2t\xi - 2\psi_k(\xi) + i\pi/\{k^2 K(k')\}}{\psi_k(\eta) + \psi_k(\xi) + t(\eta - \xi)}. \end{aligned}$$

Since

$$\frac{d}{dt} \{ \psi_k(\xi_k(t)) - t\xi_k(t) \} = -\xi_k(t), \quad \psi_k(\xi_k(0)) = \tau_k/2,$$

we have

$$(7) \quad \psi_k(\xi_k(t)) - t\xi_k(t) = \frac{\tau_k}{2} - \int_0^t \xi_k(s) ds.$$

In the same manner,

$$(8) \quad \psi_k(\eta_k(t)) + t\eta_k(t) = \frac{\tau_k}{2} + \int_0^t \eta_k(s) ds.$$

Thus

$$(9) \quad \psi_k(\eta_k(t)) + \psi_k(\xi_k(t)) + t\{\eta_k(t) - \xi_k(t)\} = l_k(t), \quad z_k^*(t) = z_k(t),$$

which yields (6).

LEMMA 4 (the lift formula). *The function $\mathcal{L}(z)$ is continuous on P and*

$$(10) \quad \mathcal{L}(z_k(t)) = \left\{ kt + \frac{1}{kt} \right\} \frac{\eta_k(t) - \xi_k(t)}{2kl_k(t)} \quad (0 < k < 1, t > 0).$$

This lemma is known in fluid dynamics ([1], [3], [13, p. 213]). The outline of the proof is as follows. For $0 < k < 1$ and $t > 0$, let $f(\zeta)$ be the Schwarz-Christoffel transformation used in the proof of Lemma 3. Then $if(\zeta)$ univalently maps $\{[-1/k, -1] \cup [1, 1/k]\}^c$ onto a domain similar to $\Gamma(z_k(t))^c$, say R . For real numbers U, V, ρ, n , we take

$$\Omega(\zeta) = U\zeta - iV \int_0^\zeta \frac{s^2 - m_k^2}{\sqrt{s^2 - 1} \sqrt{k^2 s^2 - 1}} ds - i\rho \int_0^\zeta \frac{s - n}{\sqrt{s^2 - 1} \sqrt{k^2 s^2 - 1}} ds.$$

Then $\frac{d}{dw} \Omega(h(w))$ is an analytic function in R , where $h(w)$ is the inverse function of $if(\zeta)$. Using Joukowski's hypothesis and (the argument of $\frac{d}{dw} \Omega(h(\infty)) = -\pi/2$), we determine U, V, ρ, n . Translating and normalizing R , we obtain $f_{z_k(t)}(\zeta)$. Computing $f'_{z_k(t)}(\infty)$, we obtain (10).

$$\text{LEMMA 5.} \quad \frac{\tau_k}{2} = \int_0^\infty \left\{ \frac{1}{k} - \eta_k(s) \right\} ds = \int_0^\infty \{ \xi_k(s) - 1 \} ds \quad (0 < k < 1).$$

Proof. Since

$$\frac{1}{k} - \eta_k(t) = O(t^{-2}), \quad \xi_k(s) - 1 = O(t^{-2}) \quad (t \rightarrow \infty),$$

two integrals in the required equalities converge. Equality (8) shows that

$$\int_0^t \left\{ \frac{1}{k} - \eta_k(s) \right\} ds = \frac{\tau_k}{2} - \psi_k(\eta_k(t)) + t \left\{ \frac{1}{k} - \eta_k(t) \right\}.$$

Letting t tend to infinity, we obtain

$$\int_0^\infty \left\{ \frac{1}{k} - \eta_k(s) \right\} ds = \frac{\tau_k}{2} - \psi_k(1/k) = \frac{\tau_k}{2}.$$

Thus the first equality holds. Analogously, (7) yields the second equality.

In order to prove Theorems 1 and 2, it is necessary to use the following property:

- (11) To $z \in P$, $\text{Im } z > 0$, there corresponds uniquely a pair (k, t) so that $z_k(t) = z$ and $\lambda(z) = \{z_k(s); s \geq t\} \cup \{(1+k)/(1-k)\}$.

This property will be shown in the next section. Here we give the proof of Theorems 1 and 2, assuming (11). First we give the proof of Theorem 1. For $z \in P$, $\text{Im } z > 0$, let (k, t) be the pair in (11). Equality (10) shows that

$$\begin{aligned} y'_k(s) &= -\frac{\pi}{k^2 K(k')} \frac{l'_k(s)}{l_k(s)^2} = -\frac{\eta_k(s) - \xi_k(s)}{l_k(s)} y_k(s) \\ &= \frac{2k^2 s}{1 + k^2 s^2} \mathcal{L}(z_k(s)) y_k(s) \quad (s > 0). \end{aligned}$$

Thus we have, by Lemmas 4, 5, (6) and (10),

$$\begin{aligned} \frac{\gamma(z) - 1/2}{\text{Im } z} &= \frac{\gamma(z_k(t)) - 1/2}{y_k(t)} = \frac{k^2 K(k') l_k(t)}{2\pi} \{2\gamma(z_k(t)) - 1\} \\ &= \frac{k^2 K(k')}{2\pi} \left\{ \frac{1-k}{k} \sqrt{t^2 + k^{-2}} - \tau_k - \int_0^t (\eta_k(s) - \xi_k(s)) ds \right\} \\ &= \frac{k^2 K(k')}{2\pi} \left[\frac{1-k}{k} \left\{ \sqrt{t^2 + k^{-2}} - t \right\} - \tau_k + \int_0^t \left\{ \frac{1}{k} - 1 - \eta_k(s) + \xi_k(s) \right\} ds \right] \\ &= \frac{k^2 K(k')}{2\pi} \left[\int_t^\infty \left\{ \frac{1}{k} - 1 - \frac{(1-k)s}{\sqrt{1+k^2 s^2}} \right\} ds - \int_t^\infty \left\{ \frac{1}{k} - 1 - \eta_k(s) + \xi_k(s) \right\} ds \right] \\ &= -\frac{k^2 K(k')}{2\pi} \int_t^\infty \frac{2k^2 s}{1+k^2 s^2} \left\{ \frac{1-k}{2k} \sqrt{s^2 + k^{-2}} - \frac{1+k^2 s^2}{2k^2 s} (\eta_k(s) - \xi_k(s)) \right\} ds \\ &= -\frac{1}{2} \int_t^\infty \frac{2k^2 s}{1+k^2 s^2} \{ \gamma(z_k(s)) - \mathcal{L}(z_k(s)) \} \frac{1}{y_k(s)} ds \\ &= \frac{1}{2} \int_t^\infty \frac{\gamma(z_k(s)) - \mathcal{L}(z_k(s))}{\mathcal{L}(z_k(s))} \frac{y'_k(s)}{y_k(s)^2} ds = \frac{1}{2} \int_{\lambda(z)} \left\{ \frac{\gamma(\zeta)}{\mathcal{L}(\zeta)} - 1 \right\} \frac{d(\text{Im } \zeta)}{(\text{Im } \zeta)^2}. \end{aligned}$$

This completes the proof of Theorem 1. Next we give the proof of Theorem 2. For $z \in P$, $\operatorname{Re} z > 0$, $\operatorname{Im} z > 0$, let (k, t) be the pair in (11). We write $\xi = \xi_k(t)$ and $\eta = \eta_k(t)$. Equalities (4) and (5) show that

$$\begin{aligned} (\eta - \xi)^2 &= \eta^2 + \xi^2 - 2\eta\xi \\ &= \frac{1}{1 + k^2 t^2} \{2m_k^2 + (1 + k^2)t^2 - 2\sqrt{(1 + k^2 t^2)(m_k^4 + t^2)}\}. \end{aligned}$$

Thus we have, by Lemmas 3 and 4,

$$\begin{aligned} (12) \quad \gamma(z) - \mathcal{L}(z) &= \frac{\gamma(z)^2 - \mathcal{L}(z)^2}{\gamma(z) + \mathcal{L}(z)} \\ &= \frac{1}{\{\gamma(z) + \mathcal{L}(z)\}l_k(t)^2} \left\{ \frac{(1-k)^2}{4k^4} (1 + k^2 t^2) - \frac{(1 + k^2 t^2)^2}{4k^4 t^2} (\eta - \xi)^2 \right\} \\ &= \frac{1 + k^2 t^2}{4\{\gamma(z) + \mathcal{L}(z)\}l_k(t)^2 k^4 t^2} \{(1-k)^2 t^2 - (1 + k^2 t^2)(\eta - \xi)^2\} \\ &= \frac{\gamma(z)^2}{\{\gamma(z) + \mathcal{L}(z)\}(1-k)^2 t^2} \\ &\quad \times [(1-k)^2 t^2 - \{2m_k^2 + (1 + k^2)t^2 - 2\sqrt{(1 + k^2 t^2)(m_k^4 + t^2)}\}] \\ &= \frac{2\gamma(z)^2}{\{\gamma(z) + \mathcal{L}(z)\}(1-k)^2 t^2} \{\sqrt{(kt^2 + m_k^2)^2 + (km_k^2 - 1)^2 t^2} - (kt^2 + m_k^2)\}. \end{aligned}$$

A simple calculation shows that $km_k^2 > 1$. Thus $\mathcal{L}(z) < \gamma(z)$ ($z \in P$, $\operatorname{Re} z > 0$, $\operatorname{Im} z > 0$). If $\operatorname{Re} z = 0$ and $\operatorname{Im} z > 0$, then we have

$$(13) \quad \gamma(z) - \mathcal{L}(z) = \frac{\gamma(z)^2 (km_k^2 - 1)^2}{\{\gamma(z) + \mathcal{L}(z)\}(1-k)^2 m_k^2} > 0,$$

by (12) and the continuity of $\gamma(z)$ and $\mathcal{L}(z)$. We now show that

$$(14) \quad \gamma(z) \leq \mathcal{L}(z) + \frac{C}{\log(1/\operatorname{Im} z)} \quad (z \in P, 0 < \operatorname{Im} z < 1/2)$$

for some absolute constant C . By (12), we have, with two absolute constants C_1 and C_2 ,

$$\begin{aligned} \gamma(z) - \mathcal{L}(z) &\leq \frac{\gamma(z)^2 (km_k^2 - 1)^2}{\{\gamma(z) + \mathcal{L}(z)\}(1-k)^2 (kt^2 + m_k^2)} \leq \frac{(km_k^2 - 1)^2}{(1-k)^2 (kt^2 + m_k^2)} \\ &\leq \frac{k^2 m_k^4}{(1-k)^2 m_k^2} = \frac{E(k')}{(1-k)^2 K(k')} \leq \frac{C_1}{(1-k)^2 \log(1 + (1/k))} \end{aligned}$$

and

$$\begin{aligned} \gamma(z) - \mathcal{L}(z) &\leq \frac{(km_k^2 - 1)^2}{(1 - k)^2(kt^2 + m_k^2)} = \frac{k(km_k^2 - 1)^2}{(1 - k)^2(k^2t^2 + km_k^2)} \\ &\leq \frac{k^3m_k^4}{(1 - k)^2(1 + k^2t^2)} = \frac{m_k^4}{4\gamma(z)^2kl_k(t)^2} = \frac{k^3m_k^4K(k')^2y_k(t)^2}{4\pi^2\gamma(z)^2} \\ &= \frac{E(k')^2(\text{Im } z)^2}{4\pi^2\gamma(z)^2k} \leq C_2(\text{Im } z)^2/k, \end{aligned}$$

where (k, t) is the pair associated with z . Thus

$$\gamma(z) - \mathcal{L}(z) \leq \min \left\{ \frac{C_1}{(1 - k)^2 \log(1 + (1/k))}, C_2(\text{Im } z)^2/k \right\}.$$

If $\text{Im } z \leq k$, then $\gamma(z) - \mathcal{L}(z) \leq C_2 \text{Im } z$. If $\text{Im } z > k$, then

$$\gamma(z) - \mathcal{L}(z) \leq \frac{C_1}{(1 - k)^2 \log(1 + (1/k))} \leq \frac{C_3}{\log(1/\text{Im } z)}$$

for some absolute constant C_3 , because of $0 < \text{Im } z < 1/2$. Thus

$$\gamma(z) - \mathcal{L}(z) \leq \max \left\{ \frac{C_3}{\log(1/\text{Im } z)}, C_2 \text{Im } z \right\},$$

which gives (14). Since $\gamma(z)$ and $\mathcal{L}(z)$ are continuous on P , (14) shows that the equality holds for real numbers z . This completes the proof of Theorem 2.

Inequality (13) yields that

$$\gamma(iy) - \mathcal{L}(iy) \geq C_4y \quad (0 < y < 1/2)$$

for some absolute constant C_4 . We do not know whether the order $\frac{1}{\log(1/\text{Im } z)}$ in (14) is best possible or not.

§3. Modulus-invariant arcs

To compute $\gamma(z)$ practically, it is necessary to study modulus-invariant arcs. To use later, we prepare, in this section, the following two lemmas; (15) and (16) in Lemma 6 give (11) which was used in the proof of Theorems 1 and 2.

LEMMA 6.

- (15) $z_k(t)$ is a continuous homeomorphism from $Q = \{(k, t); 0 < k < 1, t \geq 0\}$ to $P - [0, \infty)$.

(16) For $(k, t) \in \mathbb{Q}$, $\lambda(z_k(t)) = \{z_k(s); s \geq t\} \cup \{(1+k)/(1-k)\}$.

(17) For $0 < k < 1$, $x_k(t)$ is strictly increasing, and $y_k(t)$ is strictly decreasing with respect to t .

LEMMA 7. Let $a \geq 0$. Then, for any k satisfying $k_a < k < 1$ ($k_a = \max\{(a-1)/(a+1), 0\}$), there exists uniquely $t_{a,k} > 0$ such that $x_k(t_{a,k}) = a$. We have

(18) $y_k(t_{a,k})$ is continuous and strictly increasing with respect to k .

(19) $\lim_{k \rightarrow k_a} y_k(t_{a,k}) = 0$.

(20) $a\tau_k = \int_0^{t_{a,k}} \{(1-a)\eta_k(s) + (1+a)\xi_k(s)\} ds$.

Proof of Lemma 6. For $0 < k < 1$, we have

$$(21) \quad \begin{cases} x_k(0) = 0, & \lim_{t \rightarrow \infty} x_k(t) = \frac{1+k}{1-k}, \\ y_k(0) = \frac{\pi}{k^2 K(k') \tau_k}, & \lim_{t \rightarrow \infty} y_k(t) = 0. \end{cases}$$

In fact, (4) and (5) show that

$$\lim_{t \rightarrow \infty} \eta_k(t) = 1/k, \quad \lim_{t \rightarrow \infty} \xi_k(t) = 1,$$

and hence

$$\begin{aligned} \lim_{t \rightarrow \infty} x_k(t) &= 1 + 2 \lim_{t \rightarrow \infty} \int_0^t \xi_k(s) ds / \int_0^t \{\eta_k(s) - \xi_k(s)\} ds \\ &= 1 + \frac{2}{(1/k) - 1} = \frac{1+k}{1-k}. \end{aligned}$$

The other three equalities in (21) are easily seen. We have

$$(22) \quad \lim_{k \rightarrow 0} y_k(0) = 0, \quad \lim_{k \rightarrow 1} x_k(1/k') = \lim_{k \rightarrow 1} y_k(1/k') = \infty.$$

In fact, we have

$$\begin{aligned} \lim_{k \rightarrow 0} k^2 \tau_k &= 2 \lim_{k \rightarrow 0} k^2 \int_1^{m_k} \frac{m_k^2 - s^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds \\ &= 2 \lim_{k \rightarrow 0} k^2 m_k^2 \log m_k = \lim_{k \rightarrow 0} \frac{E(k')}{K(k')} \log \left\{ \frac{E(k')}{k^2 K(k')} \right\} = 2, \end{aligned}$$

which gives

$$\lim_{k \rightarrow 0} y_k(0) = \lim_{k \rightarrow 0} \frac{\pi}{k^2 K(k') \tau_k} = \frac{\pi}{2} \lim_{k \rightarrow 0} \frac{1}{K(k')} = 0.$$

Since $\lim_{k \rightarrow 1} m_k = 1$, we have, with $n_k = \sqrt{1 - k^2 m_k^2} / k'$,

$$\begin{aligned} \lim_{k \rightarrow 1} \tau_k &= 2 \lim_{k \rightarrow 1} \left\{ m_k^2 \int_{n_k}^1 \frac{ds}{\sqrt{1-s^2} \sqrt{1-k'^2 s^2}} - k^{-2} \int_{n_k}^1 \sqrt{\frac{1-k'^2 s^2}{1-s^2}} ds \right\} \\ &= 2 \lim_{k \rightarrow 1} (m_k^2 - k^{-2}) \int_{n_k}^1 \frac{ds}{\sqrt{1-s^2}} = 0. \end{aligned}$$

Recall that $\xi_k(s) > 1$, $0 < \eta_k(s) - \xi_k(s) < (1/k) - 1$. We have

$$\begin{aligned} \liminf_{k \rightarrow 1} x_k(1/k') &= 1 + \liminf_{k \rightarrow 1} 2 \int_0^{1/k'} \xi_k(s) ds / \int_0^{1/k'} \{\eta_k(s) - \xi_k(s)\} ds \\ &\geq 1 + \liminf_{k \rightarrow 1} \frac{2}{(1/k) - 1} = \infty \end{aligned}$$

and

$$\begin{aligned} \liminf_{k \rightarrow 1} y_k(1/k') &= \liminf_{k \rightarrow 1} \pi / \left\{ k^2 K(k') \int_0^{1/k'} (\eta_k(s) - \xi_k(s)) ds \right\} \\ &= \liminf_{k \rightarrow 1} \frac{2k'}{(1/k) - 1} = \infty. \end{aligned}$$

Thus (22) holds.

Since

$$l'_k(t) = \eta_k(t) - \xi_k(t) > 0,$$

$l_k(t)$ is strictly increasing, and hence $y_k(t)$ is strictly decreasing. Recall (7) and (9). Since

$$x_k(t) = 1 + \frac{2}{l_k(t)} \{-\psi_k(\xi_k(t)) + t\xi_k(t)\},$$

we have, with $\xi = \xi_k(t)$ and $\eta = \eta_k(t)$,

$$\begin{aligned} x'_k(t) &= \frac{2}{l_k(t)^2} \{\xi l_k(t) - (-\psi_k(\xi) + t\xi)(\eta - \xi)\} \\ &= \frac{2}{l_k(t)^2} \{\xi \psi_k(\eta) + \eta \psi_k(\xi)\}. \end{aligned}$$

Since $\psi'_k(t) > 0$ ($1 < t < m_k$), we have $\psi_k(\xi) > 0$. Since $\psi'_k(t) < 0$ ($m_k < t < 1/k$), we have $\psi_k(\eta) > \psi_k(1/k) = 0$. Consequently, $x'_k(t) > 0$. Thus (17) holds. Inequalities (21) show that $\lim_{t \rightarrow \infty} z_k(t) = (1+k)/(1-k)$. Thus (17)

yields (16). Let W_k be the compact set bounded by the x, y axes and $\lambda(iy_k(0))$. Then (16) and (17) show that

$$W_k \subset \left\{ x + iy; 0 \leq x \leq \frac{1+k}{1-k}, 0 \leq y \leq y_k(0) \right\},$$

$$W_k \supset \{ x + iy; 0 \leq x \leq x_k(1/k'), 0 \leq y \leq y_k(1/k') \},$$

and hence, by (22),

$$\bigcap_{0 < k < 1} W_k = [0, 1], \quad \bigcup_{0 < k < 1} W_k = P.$$

This shows that $z_k(t)$ is an onto mapping from Q to $P - [0, \infty)$. Recall that $\lambda(iy_k(0))$ is a modulus-invariant arc with modulus $\text{mod}(\{[-1/k, -1] \cup [1, 1/k]\}^c)$. The domain $\{[-1/k, -1] \cup [1, 1/k]\}^c$ is univalently mapped onto a Grötzsch's domain $G_{p_k} = \{z \in \mathbf{C}; |z| > 1\} - [p_k, \infty)$ with

$$p_k = 1 + \frac{8k}{(1-k)^2} \left\{ 1 + \frac{1+k}{2\sqrt{k}} \right\}.$$

Since $\text{mod}(G_p)$ is strictly increasing with respect to p [5, p. 72] and $p_k, (1+k)/(1-k) (= \lim_{t \rightarrow \infty} z_k(t))$ are strictly increasing with respect to k , we have

$$(23) \quad W_k \subset W_{k'}, \quad W_k \cap \lambda(iy_{k'}(0)) = \emptyset \quad (k < k').$$

Notice that $z_k(t)$ is continuous on Q (with respect to (k, t)). Since $(1+k)/(1-k) (= \lim_{t \rightarrow \infty} z_k(t))$ is continuous with respect to k , we have $\bigcap_{k < \mu < 1} W_\mu = W_k$. Thus (15) holds. This completes the proof of Lemma 6.

Proof of Lemma 7. Let $\mu(a) = \{\zeta \in \mathbf{C}; \text{Re } \zeta = a\} (a \geq 0)$. Then Lemma 6 shows that

$$\begin{aligned} \mu(a) \cap \lambda(iy_k(0)) &= \emptyset && (0 < k < k_a), \\ \mu(a) \cap \lambda(iy_k(0)) &\text{ is a singleton} && (k_a < k < 1). \end{aligned}$$

Hence, if $k > k_a$, then, by (17), there exists uniquely $t_{a,k} \geq 0$ such that $z_k(t_{a,k})$ is the unique element of $\mu(a) \cap \lambda(iy_k(0))$. Evidently, $x_k(t_{a,k}) = a$. By (15) and (23), $y_k(t_{a,k})$ is continuous and strictly increasing with respect to k . If $a > 1$, then $k_a = (a-1)/(a+1)$, and hence (16) gives (19). If $0 \leq a \leq 1$, then $k_a = 0$, and hence

$$\limsup_{k \rightarrow k_a} y_k(t_{a,k}) \leq \lim_{k \rightarrow 0} y_k(0) = 0.$$

Since

$$a = x_k(t_{a,k}) = 1 + \left\{ -\tau_k + 2 \int_0^{t_{a,k}} \xi_k(s) ds \right\} / l_k(t),$$

we have (20). This completes the proof of Lemma 7.

§4. Asymptotic behaviour of $\gamma(z)$

In this section, we show

THEOREM 8.

$$(24) \quad \gamma_y^+(0) = +\infty,$$

$$(25) \quad \gamma_y^+(a) = \frac{1}{4\pi} \log \frac{1}{a} \quad (> 0) \quad (0 < a < 1),$$

$$(26) \quad \gamma_y^+(1) < 0,$$

$$(27) \quad \gamma_y(a) = 0,$$

$$\gamma_{yy}(a) = -\frac{1}{8\pi^2} \frac{a+1}{a-1} \left\{ E\left(\frac{2\sqrt{a}}{a+1}\right) - \frac{a-1}{a+1} K\left(\frac{2\sqrt{a}}{a+1}\right) \right\}^2$$

(< 0) ($a > 1$),

where $\gamma_y^+(a) = \lim_{y \downarrow 0} \{\gamma(a+iy) - \gamma(a)\}/y$, $\gamma_y = \partial\gamma/\partial y$ and $\gamma_{yy} = \partial^2\gamma/\partial y^2$.

Equalities (25)–(27) show that $\gamma_y^+(a)$ is discontinuous at $a = 1$. We see that $\gamma_y(1) = 1/\{2\pi\sqrt{c^2-1}\} = 0.662 \dots /2\pi$, where c is the number satisfying $c/\sqrt{c^2-1} = \log(c + \sqrt{c^2-1})$ (cf. Lemma 10). Since

$$\gamma(1) = 1/2, \quad \lim_{y \rightarrow \infty} \gamma(1+iy) = 1/2,$$

(26) shows that $\gamma(1+iy)$ has the minimum in $(0, \infty)$. If $0 < a_0 < 1$ is sufficiently near to 1, the behaviour of $\gamma(a_0+iy)$ ($y > 0$) is more complicated. Let $y_0 > 0$ be a point such that $\gamma(1+iy_0) = \min_{y \geq 0} \gamma(1+iy)$. Since $\gamma(1+iy_0) < 1/2$, we can choose $0 < a_1 < 1$ so that $\max_{a_1 \leq a \leq 1} \gamma(a+iy_0)$ ($= \gamma_0$, say) is less than $1/2$. If we choose a_0 so that $\max\{a_1, 1-2(1-2\gamma_0)\} < a_0 < 1$, then $\gamma(a_0+iy_0) < \gamma(a_0)$, and hence (25) shows that $\gamma(a_0+iy)$ has a local maximum in $(0, y_0)$. Since $\gamma(a_0+iy_0) < \gamma(a_0)$ and $\lim_{y \rightarrow \infty} \gamma(a_0+iy) = 1/2$, $\gamma(a_0+iy)$ has the minimum in $(0, \infty)$. Thus $\gamma(a_0+iy)$ has at least two extrema. A calculation shows that $\lim_{a \downarrow 1} \gamma_{yy}(a) = -\infty$ and

$$\gamma_{yy}^+(1) = 2 \lim_{y \downarrow 0} \{\gamma(1+iy) - \gamma(1) - y\gamma_y^+(y)\}/y^2 = +\infty.$$

Thus $\gamma_{yy}^+(a)$ ($a \geq 1$) is also discontinuous at $a = 1$.

Here are some lemmas necessary for the proof.

LEMMA 9. $\lim_{k \rightarrow 0} kt_{a,k} = \frac{2\sqrt{a}}{1-a} \quad (0 < a < 1).$

Proof. Equalities (4) and (5) show that, with $\xi_{a,k} = \xi_k(t_{a,k})$ and $\eta_{a,k} = \eta_k(t_{a,k})$,

$$(28) \quad \frac{1 - \xi_{a,k}^2 m_k^{-2}}{\sqrt{\xi_{a,k}^2 - 1} \sqrt{1 - k^2 \xi_{a,k}^2}} = t_{a,k} m_k^{-2},$$

$$(29) \quad \frac{1 - m_k^2 \eta_{a,k}^{-2}}{\sqrt{1 - \eta_{a,k}^{-2}} \sqrt{1 - k^2 \eta_{a,k}^{-2}}} = t_{a,k} \eta_{a,k}^{-1}.$$

Equality (20) shows that

$$\begin{aligned} 0 &= -a\tau_k + \int_0^{t_{a,k}} \{(1-a)\eta_k(s) + (1+a)\xi_k(s)\} ds \\ &= (1-a) \left\{ \frac{\tau_k}{2} + \int_0^{t_{a,k}} \eta_k(s) ds \right\} + (1+a) \left\{ -\frac{\tau_k}{2} + \int_0^{t_{a,k}} \xi_k(s) ds \right\} \\ &= (1-a) \{ \psi_k(\eta_{a,k}) + t_{a,k} \eta_{a,k} \} + (1+a) \{ -\psi_k(\xi_{a,k}) + t_{a,k} \xi_{a,k} \}, \end{aligned}$$

and hence

$$\begin{aligned} (30) \quad &\eta_{a,k}^{-2} \left\{ (1+a) \int_1^{\xi_{a,k}} \frac{m_k^2 - s^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds \right. \\ &\quad \left. - (1-a) \int_{\eta_{a,k}}^{1/k} \frac{s^2 - m_k^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds \right\} \\ &= \eta_{a,k}^{-2} \{ (1+a) \psi_k(\xi_{a,k}) - (1-a) \psi_k(\eta_{a,k}) \} \\ &= t_{a,k} \eta_{a,k}^{-1} \{ (1-a) + (1+a) \xi_{a,k} \eta_{a,k}^{-1} \}. \end{aligned}$$

Let $(k_j)_{j=1}^\infty$ be a sequence tending to 0 such that $\lim_{j \rightarrow \infty} k_j \eta_{a,k_j} (= d, \text{ say})$ exists. Evidently, $0 \leq d \leq 1$. If $0 < d < 1$, then (29) shows that

$$\lim_{j \rightarrow \infty} t_{a,k_j} \eta_{a,k_j}^{-1} = \frac{1}{\sqrt{1-d^2}},$$

and hence

$$\lim_{j \rightarrow \infty} k_j t_{a,k_j} = \frac{d}{\sqrt{1-d^2}}.$$

By (28), we have

$$\lim_{j \rightarrow \infty} \xi_{a,k_j} k_j \log(1/k_j) = \frac{\sqrt{1-d^2}}{d}.$$

By (30), we have

$$\frac{1}{d^2} \{ (1 + a) - (1 - a)\sqrt{1 - d^2} \} = \frac{1 - a}{\sqrt{1 - d^2}},$$

which gives $d = 2\sqrt{a}/(1 + a)$. We show that $d \neq 0, 1$. Let $u(k)$ and $v(k)$ be the first quantity and the last quantity in (30), respectively. It holds that $u(k) = v(k)$ ($0 < k < 1$). If $d = 1$, then (29) shows that $\lim_{j \rightarrow \infty} v(k_j) = \infty$. We have

$$\limsup_{j \rightarrow \infty} u(k_j) \leq \limsup_{j \rightarrow \infty} (1 + a)\eta_{a,k_j}^{-2} m_{k_j}^2 K(k'_j) = (1 + a),$$

which contradicts (30). If $d = 0$, then (29) shows that $\limsup_{j \rightarrow \infty} v(k_j) < \infty$. By (28) and (29), we have

$$\lim_{j \rightarrow \infty} \xi_{a,k_j} k_j \log(1/k_j) = 1.$$

Hence

$$\begin{aligned} \lim_{j \rightarrow \infty} u(k_j) &= \lim_{j \rightarrow \infty} \eta_{a,k_j}^{-2} \{ (1 + a)m_{k_j}^2 \log \xi_{a,k_j} - (1 - a)k_j^{-2} \} \\ &= 2a \lim_{j \rightarrow \infty} \eta_{a,k_j}^{-2} k_j^{-2} = \infty, \end{aligned}$$

which contradicts (30). Thus $d \neq 0, 1$. Since $(k_j)_{j=1}^\infty$ is arbitrary as long as $(k_j \eta_{a,k_j})_{j=1}^\infty$ converges, we obtain $\lim_{k \rightarrow 0} k \eta_{a,k} = d = 2\sqrt{a}/(1 + a)$. Thus

$$\lim_{k \rightarrow 0} kt_{a,k} = \frac{2\sqrt{a}/(1 + a)}{\sqrt{1 - \{4a/(1 + a)\}^2}} = \frac{2\sqrt{a}}{1 - a}.$$

LEMMA 10. We have

$$\lim_{k \rightarrow 0} t_{1,k} m_k^{-2} = \frac{1}{\sqrt{c^2 - 1}},$$

where $c > 0$ is the number satisfying

$$c/\sqrt{c^2 - 1} = \log(c + \sqrt{c^2 - 1}).$$

Proof. Equalities (4) and (20) show that, with $\xi_{1,k} = \xi_k(t_{1,k})$,

$$\begin{aligned} (31) \quad & \frac{1 - \xi_{1,k}^2 m_k^{-2}}{\sqrt{\xi_{1,k}^2 - 1} \sqrt{1 - k^2 \xi_{1,k}^2}} = t_{1,k} m_k^{-2}, \\ & \int_1^{\xi_{1,k}} \frac{1 - s^2 m_k^{-2}}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds - t_{1,k} m_k^{-2} \xi_{1,k} \\ & = m_k^{-2} \{ \psi_k(\xi_{1,k}) - t_{1,k} \xi_{1,k} \} = m_k^{-2} \left\{ \frac{\tau_k}{2} - \int_0^{\xi_{1,k}} \xi_k(s) ds \right\} = 0, \end{aligned}$$

and hence

$$\frac{\{1 - \xi_{1,k}^2 m_k^{-2}\} \hat{\xi}_{1,k}}{\sqrt{\xi_{1,k}^2 - 1} \sqrt{1 - k^2 \xi_{1,k}^2}} = \int_1^{\xi_{1,k}} \frac{1 - s^2 m_k^{-2}}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds.$$

This shows that $\lim_{k \rightarrow 0} \xi_{1,k} = c$. Thus (31) yields the required equality.

LEMMA 11. *Let*

$$\Delta\gamma(z_k(t)) = \frac{\gamma(z_k(t)) - (1 + x_k(t))/4}{y_k(t)} \quad (0 < k < 1, t \geq 0).$$

Then

$$\begin{aligned} \Delta\gamma(z_k(t)) &= \frac{k^2 K(k')}{2\pi} \int_t^\infty \left\{ \eta_k(s) - \frac{s}{\sqrt{1 + k^2 s^2}} \right\} ds \\ &\quad - \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t^2}. \end{aligned}$$

Proof. We have

$$\begin{aligned} \Delta\gamma(z_k(t)) &= \frac{2\gamma(z_k(t)) - 1 + (1 - x_k(t))/2}{2y_k(t)} \\ &= \frac{1}{2y_k(t)l_k(t)} \left\{ \frac{1 - k}{k^2} \sqrt{1 + k^2 t^2} - l_k(t) + \frac{\tau_k}{2} - \int_0^t \xi_k(s) ds \right\} \\ &= \frac{k^2 K(k')}{2\pi} \left\{ \frac{1 - k}{k^2} \sqrt{1 + k^2 t^2} - \frac{\tau_k}{2} - \int_0^t \eta_k(s) ds \right\} \\ &= \frac{k^2 K(k')}{2\pi} \left\{ \frac{1}{k^2} \sqrt{1 + k^2 t^2} - \frac{t}{k} - \frac{\tau_k}{2} + \int_0^t \left(\frac{1}{k} - \eta_k(s) \right) ds \right\} \\ &\quad - \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t^2} \\ &= \frac{k^2 K(k')}{2\pi} \left\{ \frac{1}{k^2} \sqrt{1 + k^2 t^2} - \frac{t}{k} - \int_t^\infty \left(\frac{1}{k} - \eta_k(s) \right) ds \right\} \\ &\quad - \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t^2} \\ &= \frac{k^2 K(k')}{2\pi} \left\{ \int_t^\infty \left(\frac{1}{k} - \frac{s}{\sqrt{1 + k^2 s^2}} \right) ds - \int_t^\infty \left(\frac{1}{k} - \eta_k(s) \right) ds \right\} \\ &\quad - \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t^2} \\ &= \frac{k^2 K(k')}{2\pi} \int_t^\infty \left\{ \eta_k(s) - \frac{s}{\sqrt{1 + k^2 s^2}} \right\} ds - \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t^2}. \end{aligned}$$

LEMMA 12. $\gamma(z) = \frac{1}{2} + c_{k_z} \operatorname{Im} z \int_{\lambda(z)} \frac{\gamma(\zeta)^2}{\mathcal{L}(\zeta)\{\gamma(\zeta) + \mathcal{L}(\zeta)\}} h_{k_z}(\zeta) d(\operatorname{Im} \zeta)$
 $(z \in P),$

where k_z is the first number in the pair associated with z in (11),

$$\begin{aligned}
 c_k &= \frac{1}{4\pi^2 k} \{E(k') - kK(k')\}^2, \\
 h_k(\zeta) &= \{\gamma(\zeta)\sqrt{\gamma(\zeta)^2 + c'_k(\text{Im } \zeta)^2} + \gamma(\zeta)^2 + c''_k(\text{Im } \zeta)^2\}^{-1}, \\
 c'_k &= \frac{1}{4\pi^2} (1 - k)^2 K(k')^2 \{(km_k^2 - 1)^2 + 2(km_k^2 - 1)\}, \\
 c''_k &= \frac{1}{4\pi^2} (1 - k)^2 K(k')^2 (km_k^2 - 1).
 \end{aligned}$$

Proof. Let $\zeta \in \lambda(z)$. Then $k_\zeta = k_z (= k, \text{ say})$. By (12), we have

$$\begin{aligned}
 \frac{\gamma(\zeta)}{\mathcal{L}(\zeta)} - 1 &= \frac{\gamma(\zeta) - \mathcal{L}(\zeta)}{\mathcal{L}(\zeta)} \\
 &= \frac{2\gamma(\zeta)^2}{\mathcal{L}(\zeta)\{\gamma(\zeta) + \mathcal{L}(\zeta)\}(1 - k)^2 t^2} \{\sqrt{(kt^2 + m_k^2)^2 + (km_k^2 - 1)^2 t^2} - (kt^2 + m_k^2)\} \\
 &= \frac{2\gamma(\zeta)^2 (km_k^2 - 1)^2}{\mathcal{L}(\zeta)\{\gamma(\zeta) + \mathcal{L}(\zeta)\}(1 - k)^2 \sqrt{(kt^2 + m_k^2)^2 + (km_k^2 - 1)^2 t^2} + (kt^2 + m_k^2)}.
 \end{aligned}$$

Since

$$\begin{aligned}
 &\sqrt{(kt^2 + m_k^2)^2 + (km_k^2 - 1)^2 t^2} + (kt^2 + m_k^2) \\
 &= \frac{1}{k} [\sqrt{\{(1 + k^2 t^2) + (km_k^2 - 1)\}^2 + (km_k^2 - 1)^2 (1 + k^2 t^2)} - (km_k^2 - 1)^2 \\
 &\quad + (1 + k^2 t^2) + (km_k^2 - 1)] \\
 &= \frac{1}{k} [\sqrt{1 + k^2 t^2} \sqrt{(1 + k^2 t^2) + (km_k^2 - 1)^2 + 2(km_k^2 - 1)} \\
 &\quad + (1 + k^2 t^2) + (km_k^2 - 1)] \\
 &= \frac{4k^4 l_k(t)^2}{k(1 - k)^2} \left[\frac{(1 - k)\sqrt{1 + k^2 t^2}}{2k^2 l_k(t)} \right. \\
 &\quad \times \sqrt{\frac{(1 - k)^2 (1 + k^2 t^2)}{4k^4 l_k(t)^2} + \frac{(1 - k)^2 \{(km_k^2 - 1)^2 + 2(km_k^2 - 1)\}}{4k^4 l_k(t)^2}} \\
 &\quad \left. + \frac{(1 - k)^2 (1 + k^2 t^2)}{4k^4 l_k(t)^2} + \frac{(1 - k)^2 (km_k^2 - 1)}{4k^4 l_k(t)^2} \right] \\
 &= \frac{4\pi^2}{k(1 - k)^2 K(k')^2 (\text{Im } \zeta)^2} \{\gamma(\zeta)\sqrt{\gamma(\zeta)^2 + c'_k(\text{Im } \zeta)^2} + \gamma(\zeta)^2 + c''_k(\text{Im } \zeta)^2\} \\
 &= \frac{4\pi^2}{k(1 - k)^2 K(k')^2 (\text{Im } \zeta)^2} h_k(\zeta)^{-1},
 \end{aligned}$$

we have

$$\begin{aligned}
& \frac{1}{2} \int_{\lambda(z)} \left\{ \frac{\gamma(\zeta)}{\mathcal{L}(\zeta)} - 1 \right\} \frac{d(\operatorname{Im} \zeta)}{(\operatorname{Im} \zeta)^2} \\
&= \frac{kK(k')^2(km_k^2 - 1)^2}{4\pi^2} \int_{\lambda(z)} \frac{\gamma(\zeta)^2}{\mathcal{L}(\zeta)\{\gamma(\zeta) + \mathcal{L}(\zeta)\}} h_k(\zeta) d(\operatorname{Im} \zeta) \\
&= c_k \int_{\lambda(z)} \frac{\gamma(\zeta)^2}{\mathcal{L}(\zeta)\{\gamma(\zeta) + \mathcal{L}(\zeta)\}} h_k(\zeta) d(\operatorname{Im} \zeta),
\end{aligned}$$

which gives the required equality.

We now give the proof of Theorem 8. Since

$$\begin{aligned}
\Delta\gamma(z_k(0)) &= \frac{\gamma(z_k(0)) - 1/4}{y_k(0)} = \frac{k^2K(k')}{\pi} \left\{ \frac{1-k}{k^2} - \frac{\tau_k}{4} \right\} \\
&= \frac{K(k')}{\pi} \left\{ 1 - k - \frac{k^2\tau_k}{4} \right\},
\end{aligned}$$

we have (24). Let $0 < a < 1$. Then

$$\begin{aligned}
& \frac{k^2K(k')}{2\pi} \int_{t_{a,k}}^{\infty} \left\{ \eta_k(s) - \frac{s}{\sqrt{1+k^2s^2}} \right\} ds \\
&= \frac{K(k')}{2\pi} \int_{kt_{a,k}}^{\infty} \left\{ \eta_k^*(u) - \frac{u}{\sqrt{1+u^2}} \right\} du,
\end{aligned}$$

where

$$\begin{aligned}
\eta_k^*(u) &= \frac{1}{\sqrt{2(1+u^2)}} [2k^2m_k^2 + (1+k^2)u^2 \\
&\quad + \sqrt{\{2k^2m_k^2 + (1+k^2)u^2\}^2 - 4(k^4m_k^4 + k^2u^2)(1+u^2)}]^{1/2}
\end{aligned}$$

Let $d_k = k^2m_k^2 + k^2(m_k^2 - 1)(1 - k^2m_k^2)(1 - k^2)^{-1}$. Then we can write

$$\begin{aligned}
\eta_k^*(u) &= \frac{1}{\sqrt{2(1+u^2)}} [2k^2m_k^2 + (1+k^2)u^2 \\
&\quad + \sqrt{(1-k^2)^2u^4 + 4\{k^2m_k^2(1+k^2) - (k^2+k^4m_k^4)\}u^2}]^{1/2} \\
&= \frac{u}{\sqrt{1+u^2}} \left[k^2m_k^2u^{-2} + \frac{1+k^2}{2} \right. \\
&\quad \left. + \frac{1-k^2}{2} \sqrt{1 + 4k^2(m_k^2 - 1)(1 - k^2m_k^2)(1 - k^2)^{-2}u^{-2}} \right]^{1/2} \\
&= \frac{u}{\sqrt{1+u^2}} [1 + d_k u^{-2} \{1 + d_k \omega_1(k, u)\}]^{1/2} \\
&= \frac{u}{\sqrt{1+u^2}} + \frac{d_k}{2u\sqrt{1+u^2}} \{1 + d_k \omega_2(k, u)\}
\end{aligned}$$

with two functions $\omega_j(k, u)$ ($j = 1, 2$) satisfying $\sup |\omega_j(k, u)| < \infty$, where the supremum is taken over all pairs (k, u) such that $0 < k \leq 1/2$ and $u \geq \sqrt{a}/(1 - a)$. Notice that $\lim_{k \rightarrow 0} d_k = 0$ and $\lim_{k \rightarrow 0} d_k K(k') = 2$. Thus Lemmas 9 and 11 show that

$$\begin{aligned} \gamma_y^+(a) &= \lim_{k \rightarrow 0} \Delta \gamma(z_k(t_{a,k})) \\ &= \lim_{k \rightarrow 0} \left[\frac{k^2 K(k')}{2\pi} \int_{t_{a,k}}^\infty \left\{ \eta_k(s) - \frac{s}{\sqrt{1 + k^2 s^2}} \right\} ds - \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t_{a,k}^2} \right] \\ &= \lim_{k \rightarrow 0} \frac{K(k')}{2\pi} \int_{kt_{a,k}}^\infty \left\{ \eta_k^*(u) - \frac{u}{\sqrt{1 + u^2}} \right\} du \\ &= \lim_{k \rightarrow 0} \frac{d_k K(k')}{4\pi} \int_{kt_{a,k}}^\infty \frac{1}{u\sqrt{1 + u^2}} \{1 + d_k \omega_2(k, u)\} du \\ &= \lim_{k \rightarrow 0} \frac{1}{2\pi} \int_{2\sqrt{a}/(1-a)}^\infty \frac{du}{u\sqrt{1 + u^2}} = \frac{1}{4\pi} \log \frac{1}{a}. \end{aligned}$$

Thus (25) holds. Lemma 10 shows that $\lim_{k \rightarrow 0} kt_{1,k} = \infty$, and hence

$$\begin{aligned} \lim_{k \rightarrow 0} \frac{k^2 K(k')}{2\pi} \int_{t_{1,k}}^\infty \left\{ \eta_k(s) - \frac{s}{\sqrt{1 + k^2 s^2}} \right\} ds \\ = \lim_{k \rightarrow 0} \frac{d_k K(k')}{4\pi} \int_{kt_{1,k}}^\infty \frac{1}{u\sqrt{1 + u^2}} \{1 + d_k \omega_2(k, u)\} du = 0. \end{aligned}$$

By Lemmas 10 and 11, it follows that

$$\begin{aligned} \gamma_y^+(1) &= \lim_{k \rightarrow 0} \Delta \gamma(z_k(t_{1,k})) = - \lim_{k \rightarrow 0} \frac{kK(k')}{2\pi} \sqrt{1 + k^2 t_{1,k}^2} \\ &= - \frac{1}{2\pi} \lim_{k \rightarrow 0} t_{1,k} m_k^{-2} = - \frac{1}{2\pi\sqrt{c^2 - 1}} < 0. \end{aligned}$$

Thus (26) holds. Let $a > 1$. Theorem 2 shows that

$$\lim_{\zeta \rightarrow k_a, \zeta \in P} \frac{\gamma(\zeta)^2}{\mathcal{L}(\zeta)\{\gamma(\zeta) + \mathcal{L}(\zeta)\}} h_{k_a}(\zeta) = \frac{1}{4}.$$

Thus Lemmas 7 and 12 yield that

$$\gamma_y^+(a + iy) = \lim_{y \uparrow 0} \frac{\gamma(a + iy) - 1/2}{y} = -\frac{1}{4} c_{k_a} \lim_{y \uparrow 0} \int_0^y ds = 0$$

and

$$\gamma_{yy}^+(a) = 2 \lim_{y \uparrow 0} \frac{\gamma(a + iy) - 1/2}{y^2} = -\frac{1}{2} c_{k_a} \lim_{y \uparrow 0} \frac{1}{y} \int_0^y ds$$

$$\begin{aligned}
&= -\frac{1}{2}c_{k_a} = -\frac{1}{8\pi^2 k_a} \{E(k'_a) - k_a K(k'_a)\}^2 \\
&= -\frac{1}{8\pi^2} \frac{a+1}{a-1} \left\{ E\left(\frac{2\sqrt{a}}{a+1}\right) - \frac{a-1}{a+1} K\left(\frac{2\sqrt{a}}{a+1}\right) \right\}^2,
\end{aligned}$$

which shows (27). This completes the proof of Theorem 8.

§ 5. The constant σ_0

In this section, we study the following extremum problem: $\sigma_0 = \inf \gamma(x+iy)/\gamma(x)$, where the infimum is taken over all real numbers x and y . We show

THEOREM 13. *Let $\rho(a) = \min_{y \geq 0} \gamma(a+iy)/\gamma(a)$ ($a \geq 0$). Then $\sigma_0 = \rho(1)$ and $\sigma_0 < \rho(a)$ ($a \neq 1$).*

Here is a lemma necessary for the proof.

LEMMA 14. *For each $0 < k < 1$,*

(32) $\gamma(z_k(t))$ is strictly increasing,

(33) $4\gamma(z_k(t))/(1+x_k(t))$ is strictly decreasing.

Proof. Theorem 1 shows that

$$\gamma(z_k(t)) = \frac{1}{2} + \frac{y_k(t)}{2} \int_t^\infty \left\{ \frac{\gamma(z_k(s))}{\mathcal{L}(z_k(s))} - 1 \right\} \frac{y'_k(s)}{y_k(s)^2} ds,$$

and hence

$$\begin{aligned}
\frac{d}{dt} \gamma(z_k(t)) &= \frac{y'_k(t)}{2} \int_t^\infty \left\{ \frac{\gamma(z_k(s))}{\mathcal{L}(z_k(s))} - 1 \right\} \frac{y'_k(s)}{y_k(s)^2} ds \\
&\quad - \frac{y_k(t)}{2} \left\{ \frac{\gamma(z_k(t))}{\mathcal{L}(z_k(t))} - 1 \right\} \frac{y'_k(t)}{y_k(t)^2}.
\end{aligned}$$

Thus Theorem 2 and (17) yield (32). Since

$$\begin{aligned}
\frac{1+x_k(t)}{4} &= \frac{1}{2l_k(t)} \left\{ l_k(t) - \frac{\tau_k}{2} + \int_0^t \xi_k(s) ds \right\} \\
&= \frac{1}{2l_k(t)} \left\{ \frac{\tau_k}{2} + \int_0^t \eta_k(s) ds \right\} = \frac{1}{2l_k(t)} \{ \psi_k(\eta_k(t)) + t\eta_k(t) \},
\end{aligned}$$

we have, by (6),

$$\begin{aligned}
 (34) \quad \frac{d}{dt} \frac{4\gamma(z_k(t))}{1+x_k(t)} &= \frac{1-k}{k^2} \frac{d}{dt} \frac{\sqrt{1+k^2t^2}}{\psi_k(\eta_k(t)) + t\eta_k(t)} \\
 &= \frac{1-k}{k^2\{\psi_k(\eta_k(t)) + t\eta_k(t)\}^2} \\
 &\quad \times \left[\frac{k^2t}{\sqrt{1+k^2t^2}} \{\psi_k(\eta_k(t)) + t\eta_k(t)\} - \sqrt{1+k^2t^2} \eta_k(t) \right] \\
 &= \frac{1-k}{k^2\sqrt{1+k^2t^2} \{\psi_k(\eta_k(t)) + t\eta_k(t)\}^2} \{k^2t\psi_k(\eta_k(t)) - \eta_k(t)\}.
 \end{aligned}$$

Since $m_k > 1$, we have, with $\eta = \eta_k(t)$,

$$\begin{aligned}
 k^2t\psi_k(\eta) &= k^2t\{\psi_k(\eta) - \psi_k(1/k)\} \\
 &= \frac{k^2(\eta^2 - m_k^2)}{\sqrt{\eta^2 - 1} \sqrt{1 - k^2\eta^2}} \int_{\eta}^{1/k} \frac{s^2 - m_k^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2s^2}} ds \\
 &< \frac{k^2\eta}{\sqrt{1 - k^2\eta^2}} \int_{\eta}^{1/k} \frac{s}{\sqrt{1 - k^2s^2}} ds = \eta.
 \end{aligned}$$

Hence the first quantity in (34) is negative, which gives (33).

We now give the proof of Theorem 13. Let $a > 1$. Since $\lim_{y \rightarrow \infty} \gamma(a + iy)/\gamma(a) = 1$, there exists $y_a \geq 0$ such that

$$\rho(a) = \gamma(a + iy_a)/\gamma(a) = 2\gamma(a + iy_a).$$

By (27), we have $y_a > 0$. Hence there exists a pair (k^0, t^0) such that $a + iy_a = z_{k^0}(t^0)$. Let $t^1 > 0$ be the number such that $x_{k^0}(t^1) = 1$. Then $t^1 < t^0$. Hence, by (32), it follows that

$$\rho(1) \leq \gamma(z_{k^0}(t^1))/\gamma(1) = 2\gamma(z_{k^0}(t^1)) < 2\gamma(z_{k^0}(t^0)) = \rho(a).$$

Inequality (26) shows that $\rho(1) < 1$. Let $0 \leq a < 1$. Then there exists $y_a \geq 0$ such that

$$\rho(a) = \frac{\gamma(a + iy_a)}{\gamma(a)} = \frac{4\gamma(a + iy_a)}{1 + a}.$$

If $y_a = 0$, then $\rho(1) < 1 = \rho(a)$. If $y_a > 0$, then there exists a pair (k^0, t^0) such that $a + iy_a = z_{k^0}(t^0)$. Let $t^1 > 0$ be the number such that $x_{k^0}(t^1) = 1$. Then $t^1 > t^0$. Hence, by (33), it follows that

$$\begin{aligned}
 \rho(1) &\leq 4\gamma(z_{k^0}(t^1))/(1 + x_{k^0}(t^1)) \\
 &< 4\gamma(z_{k^0}(t^0))/(1 + x_{k^0}(t^0)) = \rho(a).
 \end{aligned}$$

Thus

$$\rho(1) = \min_{a \geq 0} \rho(a), \quad \rho(1) < \rho(a) \quad (a \neq 1).$$

which gives the required inequalities in Theorem 13. This completes the proof of Theorem 13.

From the point of view of Vitushkin-Garnett's example, it is interesting to estimate σ_0 . A rough estimate is given as follows. The Garabedian function [2, p. 19] of an interval $[-1/2, 1/2]$ is given by

$$\psi(\zeta) = \frac{1}{2} \left\{ 1 + \frac{\zeta}{\sqrt{\zeta^2 - (1/4)}} \right\};$$

in fact,

$$\frac{1}{2\pi} \int_{\partial[-1/2, 1/2]} |\psi(\zeta)| |d\zeta| = \frac{1}{4\pi} \int_{-1/2}^{1/2} \frac{ds}{\sqrt{(1/4) - s^2}} = \frac{1}{4}.$$

Since $\psi(\zeta)\psi(\zeta + 1 + iy)$ is analytic outside $\Gamma(1 + iy)$ and equal to 1 at infinity, we have

$$\gamma(1 + iy) \leq \frac{1}{2\pi} \int_{\partial\Gamma(1 + iy)} |\psi(\zeta)\psi(\zeta + 1 + iy)| |d\zeta| \quad (\text{cf. [2, p. 19]}).$$

Thus Theorem 13 shows that

$$(35) \quad \sigma_0 \leq \inf_{y \geq 0} \frac{1}{\pi} \int_{\partial\Gamma(1 + iy)} |\psi(\zeta)\psi(\zeta + 1 + iy)| |d\zeta|.$$

We can easily compute the right-hand side of (35). The estimate by this method is rough, however, this method gives a new approach to the construction of sets of Vitushkin-Garnett type (cf. [8, p. 81]). In order to get a better estimate, it is necessary to study, in detail, incomplete elliptic integrals. Recall that

$$\begin{aligned} \sigma_0 &= \min_{0 < k < 1} 2\gamma(z_k(t_{1,k})), \\ \gamma(z_k(t)) &= \left\{ \frac{1-k}{2k} \sqrt{t^2 + k^{-2}} \right\} / l_k(t), \\ l_k(t) &= \psi_k(\eta_k(t)) + \psi_k(\xi_k(t)) + t\{\eta_k(t) - \xi_k(t)\}, \\ \psi_k(x) &= \int_1^x \frac{m_k^2 - s^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds \quad (1 \leq x \leq 1/k). \end{aligned}$$

Since

$$\psi_k(x) = -\psi_k(1/k) + \psi_k(x) = \int_x^{1/k} \frac{s^2 - m_k^2}{\sqrt{s^2 - 1} \sqrt{1 - k^2 s^2}} ds,$$

we have, by making the substitution $1 - k^2s^2 = k'^2u^2$,

$$\begin{aligned} \psi_k(x) &= k^{-2} \int_0^{\nu(x)} \sqrt{\frac{1 - k'^2u^2}{1 - u^2}} du - m_k^2 \int_0^{\nu(x)} \frac{du}{\sqrt{1 - u^2} \sqrt{1 - k'^2u^2}} \\ &= k^{-2} E(\arcsin \nu(x), k') - m_k^2 F(\arcsin \nu(x), k'), \end{aligned}$$

where $\nu(x) = \sqrt{1 - k^2x^2}/k'$. Thus $\psi_k(x)$ can be computed with the aid of Landen's transformation [4, p. 250] or Jacobian theta functions [4, p. 292]. (As is well known, Landen's transformation yields that

$$\begin{aligned} F(\varphi, k') &= \frac{1}{1 + k} F\left(\psi, \frac{1 - k}{1 + k}\right), \\ E(\varphi, k') &= -\frac{k(1 + k)}{2} F(\varphi, k') + \frac{1 + k}{2} E\left(\psi, \frac{1 - k}{1 + k}\right) + \frac{1 - k}{2} \sin \psi, \end{aligned}$$

where ψ is defined by $\tan(\psi - \varphi) = k \tan \varphi$. Since $(1 - k)/(1 + k) < k'$, we can compute $E(\varphi, k')$ and $F(\varphi, k')$ by repeating this formula.) Equality (20) for $a = 1$ can be rewritten as

$$0 = \frac{\tau_k}{2} - \int_0^{t_{1,k}} \xi_k(s) ds = \psi_k(\xi_k(t_{1,k})) - t_{1,k} \xi_k(t_{1,k}),$$

and hence

$$m_k t_{1,k} = t_{1,k} \{m_k - \xi_k(t_{1,k})\} + \psi_k(\xi_k(t_{1,k})).$$

We now inductively define a sequence $(t_{1,k}^{(n)})_{n=0}^\infty$ by $t_{1,k}^{(0)} = 0$,

$$m_k t_{1,k}^{(n)} = t_{1,k}^{(n-1)} \{m_k - \xi_k(t_{1,k}^{(n-1)})\} + \psi_k(\xi_k(t_{1,k}^{(n-1)})) \quad (n \geq 1).$$

Since

$$t \{m_k - \xi_k(t)\} + \psi_k(\xi_k(t)) = \frac{\tau_k}{2} + \int_0^t \{m_k - \xi_k(s)\} ds,$$

we have

$$\begin{aligned} m_k |t_{1,k}^{(n)} - t_{1,k}^{(n-1)}| &= \left| \int_{t_{1,k}^{(n-1)}}^{t_{1,k}^{(n)}} \{m_k - \xi_k(s)\} ds \right| \\ &\leq (m_k - 1) |t_{1,k}^{(n-1)} - t_{1,k}^{(n-2)}| \quad (n \geq 2), \end{aligned}$$

and hence

$$|t_{1,k} - t_{1,k}^{(n)}| \leq \sum_{l=n}^\infty (1 - m_k^{-1})^l |t_{1,k}^{(1)}| = \frac{m_k \tau_k}{2} (1 - m_k^{-1})^n \quad (n \geq 0).$$

This shows that $(t_{1,k}^{(n)})_{n=0}^{\infty}$ converges to $t_{1,k}$. (In the case where k is small, the speed of the convergence of $(t_{1,k}^{(n)})_{n=0}^{\infty}$ is slow. Hence, by using $(t_{1,k}^{(n)})_{n=0}^{\infty}$, we choose first $\tilde{t}_{1,k}$ sufficiently near to $t_{1,k}$ and define next $(\tilde{t}_{1,k}^{(n)})_{n=0}^{\infty}$ by $\tilde{t}_{1,k}^{(0)} = \tilde{t}_{1,k}$,

$$\tilde{t}_{1,k}^{(n)} = \tilde{t}_{1,k}^{(n-1)}\{1 - \varepsilon_k \xi_k(\tilde{t}_{1,k}^{(n-1)})\} + \varepsilon_k \psi_k(\xi_k(\tilde{t}_{1,k}^{(n-1)})) \quad (n \geq 1),$$

where $\varepsilon_k > 0$ is chosen so that the convergence of $(\tilde{t}_{1,k}^{(n)})_{n=0}^{\infty}$ is rapid. Notice that $t_{1,k} = \lim_{n \rightarrow \infty} \tilde{t}_{1,k}^{(n)}$. Thus we can compute $2\gamma(z_k(t_{1,k}))$ ($0 < k < 1$). The author expresses his thanks to Prof. Yonezawa and Mr. Sakurai who practiced our program. Prof. Yonezawa shows that $0.95 \leq \sigma_0 \leq 0.97$. (σ_0 is attained when k is near to 0.1.)
