

Analysis followed the well-recognised six stages of thematic analysis. Two authors read and coded all text independently, before discussing any discrepancies and then defining and refining themes with involvement from all authors, in a process of several reviews.

Results. Five themes emerged from the data: 1) Mixed feelings about the placement (with anxiety being prominent), 2) Mixed views about patient behaviour with many assumed to be violent, 3) Caring and holistic-minded staff, 4) A restrictive and locked environment, 5) Assumed similarities to acute general hospital care. Some of the expectations of students were markedly different to the realities of psychiatric inpatient and intensive settings, with students reporting ideas of patients in locked rooms, physically restrained, sedated and attached to ventilators.

Conclusion. This study offers a unique insight into what medical students expect from their psychiatry placement, a key issue of which all educators and clinicians who supervise students should be aware. Results can inform better student preparation and placement supervision, leading to more meaningful learning and improved well-being.

Introducing the Emotional Logic Method as a Self-Care Approach for Staff Well-being

Dr Rosie England^{1*}, Dr Marian Langsford² and Dr Feroz Nainar¹

¹Birmingham Community Healthcare NHS Foundation Trust, Birmingham, United Kingdom and ²Emotional Logic Centre, Devon, United Kingdom

*Corresponding author.

doi: 10.1192/bjo.2023.124

Aims. The Emotional Logic method teaches that although unpleasant, all emotions have an inbuilt useful purpose. Through recognising our emotional responses to situations, this solution-focused approach helps us discover the hidden losses behind our emotions, empowering us to move forwards. Activating our inner Emotional Logic can help to build emotional resilience, improve self-awareness, strengthen relationships and reduce burn out.

Methods. The Emotional Logic method was introduced to staff across the Learning Disability Psychiatry Division during a two hour webinar. The session was advertised via email circular to all staff with an emphasis on using the method for self-care. It was attended by thirty-two, clinical and non-clinical staff from across the multi-disciplinary team. Interactive polls were used during the session as well as feedback forms at the end.

Results. In Emotional Logic, a safe place is a physical place, relationship or mindset that we can visit when we are doubting our resources to cope, here we can let our emotions settle and make a plan. An interactive poll during the session showed that 98% of staff could identify a safe place. This was reduced to only 52% when asked if they could identify an accessible safe place at work.

The session overall was rated as 4.57 (on a scale of 1 (poor)-5(excellent)) 90% said they felt Emotional Logic was relevant to them personally, with the remaining 10% answering "maybe." Qualitative feedback included: "I thoroughly enjoyed all aspects of the session which would benefit me personally and on a professional level" "Helped me to manage my thoughts/control my thoughts" "Its always hard to take a

look at yourself and your behaviors or reactions to things that impact you on a daily basis and I think that a lot of people would find it a real benefit." 86% said they would be interested in further learning.

Conclusion. In order to care for other people, we need to first look after ourselves. The striking statistic that 48% of staff do not have an accessible safe place at work highlighted the importance of providing staff with the tools to help improve their own well-being. The session was an introductory session, which will be built on through offering follow up workshops and formal courses. The aim of these will be to improve self-care whilst also providing a language to use with colleagues and patients to help everybody move forwards.

doi: 10.1192/bjo.2023.125

Aims. Balint groups explore the clinician-patient relationship, with benefits for empathy, resilience, and interpersonal skills. Their use with medical students is increasing, but more research is needed to understand how their benefit, feasibility and accessibility can be optimised. We aimed to explore this over a one-year pilot of a medical student Balint group programme.

Methods. An explanatory sequential mixed methods design was used. Eight medical student Balint groups ran for six weeks during 2022–2023, with 90 students participating. Students completed quantitative and qualitative feedback at the end of each cohort. Themes were identified using qualitative content analysis. Balint group leaders kept reflective session notes and used these alongside student feedback to undertake a strengths, weaknesses, opportunities and threats analysis of the programme.

Results. Students reported a neutral to slightly positive experience of the groups. Strengths were coded as containment, learning, and community identity. Students identified weaknesses due to pace, facilitation, and anxiety. Threats to the future success of the Balint group programme were related to engagement and the group being perceived as inauspicious and intimidating. Potential opportunities to develop the Balint group programme included widening participation and sharpening focus. The strengths, weaknesses, opportunities, and threats identified by the group leaders were in line with those of the students, but also acknowledged the broad range of ethico-legal material discussed by students, timetabling and organisational challenges. A range of opportunities were identified for how the Balint group programme could optimally enrich the clinical curriculum.

Conclusion. Integrating successful Balint groups into the medical school curriculum is challenging on individual and organisational levels. However, students perceive value in these groups, and they provide a unique space to combine learning and emotional support with personal, professional and community development. Ongoing consideration is needed to optimally and sustainably

incorporate Balint groups within the undergraduate medical curriculum.

Psychodynamic Psychiatry Education and Training for Health Care Staff in the Acute Hospital Setting

Ms. Lorna Bo¹, Dr James FitzGerald^{2*}, Dr Fraser Arends² and Dr Pamela Peters²

¹University of Cambridge, Cambridge, United Kingdom and

²Cambridgeshire and Peterborough NHS Foundation Trust, Cambridge, United Kingdom

doi: 10.1192/bjo.2023.126

Aims. Psychodynamic psychiatry training seminars are a blended supervision and experiential style approach to training health care professionals in reflective practice and formulation. They apply psychodynamic theory through case formulations, seminars, and Balint groups so that healthcare staff can improve their communication style, formulation skills and enhance their appreciation for patients with complex mental health problems. Our aim is to evaluate the provision of our psychodynamic psychiatry training sessions for healthcare staff in the Cambridge University Hospitals (CUH) NHS Foundation Trust, and to evaluate the perceived benefits of attending in terms of personal and professional development.

Methods. Convenience sampling was used to recruit CUH doctors, nurses, and healthcare assistants at all stages of training as part of their in-house teaching schedule. Sessions were delivered via an online format or in person. The evaluation period was between October 2021 and July 2022. Data were gathered via a survey tool, adapted from the literature using Likert scales and free text questions to identify barriers and facilitators to the sessions

Results. Thirty-three participants responded to our survey, with the sample consisting of gastroenterology (n = 4), acute medicine (n = 6), and emergency medicine doctors (n = 10). The sample also included emergency department nurses (n = 8) and health care assistants (n = 5). Most respondents (>90%) described the experience of the sessions including the material covered as 'Positive' or 'Very Positive'. All participants felt they were able to express themselves in the session and the majority (>97%) felt that the sessions were relevant to their training needs and focused on the right issues. Notably, most participants (>88%) felt the sessions enhanced their ability to recognise the importance of the therapeutic relationship, the emotional significance of symptoms as well as the impact of group dynamics on patient's presentations.

Conclusion. Our findings suggest that these psychodynamic psychiatry training seminars provide an effective, safe, non-judgemental space for experimentation and interdisciplinary discussion to support healthcare staff management of complex patients. Our results support the expansion of this low-cost, high-value intervention for both the well-being and professional development of healthcare staff.

Psychodynamic Psychiatry Education and Training for Trainee Psychiatrists

Dr James FitzGerald^{1*}, Ms. Lorna Bo², Dr Fraser Arends¹ and Dr Pamela Peters¹

¹Cambridgeshire and Peterborough NHS Foundation Trust, Cambridge, United Kingdom and ²University of Cambridge, Cambridge, United Kingdom

*Corresponding author.

doi: 10.1192/bjo.2023.127

Aims. Psychodynamic psychiatry training seminars are a blended supervision and experiential style approach to training health care professionals in reflective practice and formulation. They apply psychodynamic theory through case formulations, seminars, and Balint groups so that health care staff can improve their communication style, formulation skills and enhance their appreciation for patients with complex mental health problems. Our aim is to evaluate the provision of our psychodynamic psychiatry training sessions for psychiatry trainees in the Cambridgeshire and Peterborough NHS Foundation Trust, and to evaluate the perceived benefits of attending in terms of personal and professional development.

Methods. The evaluation used a standardized mixed-methods approach, with the sample consisting of psychiatry core trainees as part of the regional MRCPsych course. Sessions were delivered via an online format. The evaluation period was between November 2021 and January 2023. Data were gathered via a survey tool, adapted from the literature using Likert scales and free text questions to identify barriers and facilitators to the sessions.

Results. The survey collated data from thirty-seven core trainees ranging between CT1 to CT3. The majority of participants (> 90%) scored the sessions positively across the board in terms of the content of session material, length of training, and quality of delivery. The majority of attendees felt the sessions focused on the relevant clinical issues (97%), were relevant to their training (95%), and felt the group was a safe place to express and process anxieties and frustrations about their work (89%). Notably, the majority either agreed or strongly agreed the group had changed the way they think and practice (91%), including an appreciation of the emotional and symbolic aspects of patients' presentations (89%).

Conclusion. This evaluation reports early findings on psychodynamic psychiatry teaching for psychiatry trainees. Overall, the participants felt the sessions were relevant to their training and improved their personal and professional development. Key benefits of the sessions included increased insight into the emotional and symbolic aspects of the patient's symptoms and clinical issues, team working through cohesion, and the humanity of the doctor in the clinical relationship with the patient. This suggests that the sessions provide a much-needed space to process and reflect on the often-intense demands of clinical work and training. The main theme within barriers to the group processes was external in terms of other clinical demands requiring prioritization.
