REHABILITATION IN SOCIAL COGNITION FOR BIPOLAR PATIENTS: A STATE OF THE ART

J. Montes

Psychiatry, Hospital del Sureste, Arganda del Rey, Spain

Deficits in social cognition have been reported in euthymic bipolar patients. Thus, these deficits could be determining the disability observed in these patients for achieving the functionality expected at work or in sociability. In this way, there is a need for specific programs of rehabilitation in social cognition in bipolar disorder. Unfortunately, there is a paucity of programmes designed for improving social cognition in bipolar patients. A review of these programmes will be presented.
