

The Ecology of Tropical Lakes and Rivers

A.I. PAYNE

This account of the biology and management of tropical inland water draws together the diverse threads of fresh-water ecology over one of the earth's major climatic belts - from the cold and frozen lakes of the Andes, to the deep lakes of the East African Rift Valley; from the shallow, highly productive soda lakes more concentrated than sea-water to the almost demineralized waters of streams and rivers of the lowland environments. The tropics also present some rather singular biological problems which are fully discussed here, particularly those associated with seasonality, diversity and evolution of species. Man's immediate requirements are also taken into account through a consideration of fisheries, aquaculture, pollution, sanitation and other health aspects of tropical inland waters.

Wildlife Resources and Economic Development

S.K. ELTINGHAM

This "most useful reference" (*New Scientist*) considers the commercial value of the world's wildlife resources, both the biological potential and the problems involved in realising that potential. The ecological principles upon which wildlife exploitation must be based are described with particular attention paid to the theory of sustainable yield harvesting. Wildlife stocks considered include whales, seals and other marine mammals, terrestrial fur-bearers, ungulates, primates, rodents, birds, reptiles, amphibians, fish and invertebrates. Possibilities in the ranching and domestication of present-day wild animals are discussed with particular reference to recent experiments in game ranching and deer farming and the potential for deer farming throughout the world is considered. The economics of big game hunting and other field sports are examined and special attention is given to the role of wildlife tourism in the development of Third World countries. The place of wildlife in primitive societies is reviewed and the value of trade in wild animals and their products are summarised and discussed for each group. Finally, the future of wildlife in a world of expanding human populations is considered. Throughout, a critical attitude is taken towards conventional assumptions about wildlife exploitation.

Plant Ecology in West Africa Systems and Processes

Edited by G.W. LAWSON

Covers all types of vegetation, the ecological processes, and to some extent the physiological processes that occur in these vegetation types.

0471903647 app 384pp September'86 app £35.00/\$57.50

Remote Sensing and Tropical Land Management

Edited by M.J. EDEN and J.T. PARRY

A collection of research-based studies on the use of remote sensing as an aid to the management of renewable resources in the tropics. It covers the use of airborne and satellite remote sensing techniques for both survey and monitoring purposes (the latter being a critical and developing area in remote sensing). The book focuses particularly on forests, range-lands and agricultural lands, and is written for geography and remote sensing undergraduates upwards, and university and government/development agency staff.

0471908894 400pp July'86 £37.00/\$63.00

Nutrient Cycling in Tropical Forest Ecosystems

CARL F. JORDAN

There is much current concern about the effect of deforestation on productive potential and resilience of tropical forest ecosystems, because of increasing evidence that most tropical soils are much less fertile, and more easily leached and eroded than temperate zone soils. This book addresses these concerns by bringing together much of the recent literature on nutrient cycling in tropical forests, and changes in the cycles following conversion to croplands, pastures, and plantation forests; it explains why nutrients are often very critical in tropical humid ecosystems, and discusses principles that can guide land managers to conserve nutrients and sustain productivity. Because the book gives the scientific basis for technologies to sustain tropical forest resources, it will be of interest to professionals in agencies concerned with development in the tropics, as well as students interested in tropical ecology.

Evolution

Essays in Honour of John Maynard Smith

Edited by P J GREENWOOD, P H HARVEY and M W SLATKIN

This volume contains a collection of new and original essays by the foremost authorities in current evolutionary thinking. The contributions were all inspired by Maynard Smith's writings and span the whole field of evolutionary biology under three section headings of: Population Genetics and Evolution Theory; Adaptations, Constraints and Patterns of Evolution; The Evolutionary Ecology of Sex.

The Evolutionary Ecology of Ant-Plant Mutualisms

ANDREW J BEATTIE

This important work is the first broad and thorough treatment of the subject of ant-plant mutualisms. Professor Beattie reviews the fascinating natural history of the interactions between ants and plants, discusses the scientific evidence for the mutualistic nature of these relationships, and reaches some conclusions about the ecological and evolutionary processes that mould them.

Reproduction in Mammals, Book 4

Reproductive Fitness

Second edition

Edited by C R AUSTIN and R V SHORT

In this revised edition, leading experts describe the genetic, environmental, behavioural and immunological mechanisms that can contribute to overall reproductive fitness.

Contributors: R M MAY; D I RUBENSTEIN; R V SHORT; R B LAND; B K FOLLETT; E B KEVERNE; N J ALEXANDER; D J ANDERSON; C E ADAMS.

Evolutionary Ecology of Marsupials

A K LEE and A COCKBURN

This book attempts to provide a synthesis of the vast quantity of descriptive natural history data available on marsupials and the burgeoning literature on behavioural and evolutionary ecology. In a fascinating treatment the impressive diversity of marsupial life history strategies and trophic roles is documented, and the potential for examining kinship effects in these pouch-breeders is considered.

Contrast Analysis

Focused Comparisons in the Analysis of Variance

ROBERT ROSENTHAL and RALPH L ROSNOW

This is the first text that is devoted entirely to the topic of contrasts. It is written for those seeking appropriate statistical approaches to research data and will prove particularly useful to behavioural and social scientists.

Pests and Parasites as Migrants

Edited by **ADRIAN GIBBS** and **ROGER MEISCHKE**

From an Australian perspective, this book discusses the scientific, social and legal aspects of the migration of plants, animals and microbes. It considers both the rise to pest proportions of organisms such as the rabbit and prickly pear and the use of other introduced species as control agents of these pests.

192 pp. 1986 0 521 30163 7 **Paperback £22.50 net**

Ecology, Recreation and Tourism

JOHN M. EDINGTON and **ANN EDINGTON**

This book introduces some of the factors which should be taken into account when planning and designing recreational and tourist facilities, if damage to the environment is to be avoided. Working from basic ecological principles the impact of recreational damage is considered, followed by a discussion of the constraints that biological agents (e.g. insects, diseases etc.) can place on the use of a given site. The final chapter discusses the design of resorts and associated facilities which results from such considerations.
