CURRENT PRIORITIES OF INVESTIGATION OF MENTAL HEALTH OF GROWING GENERATION

V.Y. Semke

Borderline States Department, Mental Health Research Institute, Tomsk, Russia

Complex approach allows identifying from many-sided positions integrative trends in research of mental health of growing generation. The case in point is evolutionary analysis of risk factors, role of adverse microsocial environment, negative impact of exogenous-organic and endogenous harms. In this aspect of relevance is distinguishing and all-sided development of new branch of the contemporary medicine - micropsychiatry (for this there are interesting basic data on grounding and propriety of description ecological fetal syndrome reflecting, in particular, influence of microdoses of radiation of negative consequences of the Semipalatinsk polygon etc.). Avalanche-like growth of indices of child homelessness and neglect is explained by consequences of microsocial crisis that is experienced by Russian family: this makes extraordinarily relevant problem of social orphanhood. The great attention must be paid to problem of mental health care of participants of pedagogical process (in a-chain-like-way "parent-child-teacher").

Researchers and physicians of child-adolescent subdivision of SI Mental Health Research Institute TSC SB RAMSci conduct work on psychotherapy of childhood and adolescence. In addition, there are many-year results of trials in the field of child-adolescent transculturology, conducted under auspices of the International Association of Ethnopsychologists and Ethnopsychotherapists (with active participation of Siberian scientists and physicians). Efforts of young researchers and representatives of older generation promote the successful development of new media, organizing-medical and preventive technologies allowing resolving the complex of tasks in heightening and mastering "quality of life" of Russian families, strengthening of the individual and societal health of the population of various regions of the country.
