

AN INVESTIGATION ON THE LOGICAL STRUCTURE OF MATHEMATICS (III)⁰⁾

FUNDAMENTAL DEDUCTIONS

SIGEKATU KURODA

In this Part (III) the proofs in UL are given for fundamental formulas concerning the following dependent variables:

Elementary set	$\{a_1, \dots, a_n\};$
Ordered pair ¹⁾	$\langle a, b \rangle;$
Image ²⁾ by σ of a	$\sigma'a;$
Image ²⁾ by σ of elements of a	$\sigma''a;$
Domain of operator	$D_\sigma;$
Range of operator	$W_\sigma;$
Uniqueness	$Un;$
Bi-uniqueness	$Un_2;$
Inverse operator	$\sigma^{-1};$
One-to-one mapping	$Map_2^{a, b};$
Composition of operators	$\sigma \circ \tau;$
Restriction of operator	$\sigma \upharpoonright a;$
Identical mapping	$\iota.$

The following defining formulas are used for these dependent variables:

$$u \in \{a_1, \dots, a_n\} \equiv u = a_1 \vee \dots \vee u = a_n,$$

$$u \in \langle ab \rangle \equiv u = \{a\} \vee u = \{ab\},$$

$$u \in \sigma'a \equiv \exists x. \langle ax \rangle \in \sigma \wedge u \in x,$$

$$u \in \sigma''a \equiv \exists x. x \in a \wedge \langle xu \rangle \in \sigma,$$

$$u \in D_\sigma \equiv \exists x. \langle ux \rangle \in \sigma,$$

$$u \in W_\sigma \equiv \exists x. \langle xu \rangle \in \sigma,$$

$$u \in Un \equiv \forall xyz. \langle xy \rangle \in u \wedge \langle xz \rangle \in u \rightarrow y = z,$$

Received February 19, 1958.

⁰⁾ See foot note ⁰⁾ in Part (IV) published in this same volume.

¹⁾ $\langle a, b \rangle$ is also written as $\langle ab \rangle$.

²⁾ $\sigma'a$ as well $\sigma''a$ are also written in the same way as a^σ , when the distinction is clear by the context.

$$\begin{aligned}
 u \in \text{Un}_2 &\equiv u \in \text{Un} \wedge u^{-1} \in \text{Un}, \\
 u \in \sigma^{-1} &\equiv \exists xy. u = \langle xy \rangle \wedge \langle yx \rangle \in \sigma, \\
 u \in \text{Map}_2^{a,b} &\equiv u \in \text{Un}_2 \wedge D_u = a \wedge W_u = b, \\
 u \in \sigma \circ \tau &\equiv \exists xyz. u = \langle xz \rangle \wedge \langle xy \rangle \in \tau \wedge \langle yz \rangle \in \sigma, \\
 u \in \sigma \upharpoonright a &\equiv \exists xy. u = \langle xy \rangle \wedge u \in \sigma \wedge x \in a, \\
 u \in \iota &\equiv \exists x. u = \langle xx \rangle.
 \end{aligned}$$

Besides these dependent variables, we use the universal constant V and $a \cap b$. All the dependent variables used in the following deductions are the variables listed above, or those which are results of successive substitutions of the above listed dependent variables, such as $\langle aa^2 \rangle$, $(\sigma \circ \tau)^a$, $D_\sigma \upharpoonright a$ etc.

Since the variables defined above belong all to the consistent V-system,³⁾ all the formulas proved in this Part (III) are not only theorems of UL, but also theorems of the consistent V-system of UL. Specifically, the variables Un , Un_2 , $\text{Map}_2^{a,b}$, and also D_m , W_m with independent or dependent variable m are not used as sets but only as concepts in the following deductions.⁴⁾

The formulas proved in this Part (III) are not an arbitrary collection of formulas but are those which are needed as ordinary cuts in the deduction in UL of some branches of mathematics. Hence, most of the fundamental properties, though not all, of these dependent variables are deduced in this part.

Our purpose of these deductions is to construct mathematics, as far as possible, consistently in UL. On the one hand, we know some part of abstract mathematics is consistent. On the other hand, we know also some part of concrete mathematics is consistent. The most essential part of the consistency proof consists in those subsystems of UL in which concrete and abstract mathematics, or our formal and intuitive knowledge, are combined. In virtue of the strong theorem of Gödel on the impossibility⁵⁾ of the proof of consistency

³⁾ Cf. Part (VI).

⁴⁾ What dependent variables are used as sets (see Part (X)) can be seen from each proof, although we do not list up in each case. Such a list is needed, for instance, in the observation of Burali-Forti's contradiction.

⁵⁾ Impossible in the sense precisely formulated and proved by Gödel. Moreover, if there were a criterion for any premise σ of UL to be consistent or inconsistent, then either the proof for the criterion could be, after Gödel mapping, formalized in UL and the premise τ of the formalized proof for the criterion would turn out to be inconsistent by the criterion itself, or UL would be still narrow enough to formalize our logical thought. This would mean almost absolute impossibility of such criterion; or else, the criterion or the proof for it would be expressed by means of such part of intuitive logic or mathematics that would be susceptible of no formalization.

as well as in virtue of the difficulty of the problem shown by the development in these decades, it seems almost hopeless to solve the consistency problem by a "once-and-for-all" method as was originally planned by Hilbert. However, it seems there remains yet a "step-by-step" method by which we gradually increase the parts of mathematics which are proved to be consistent. Hence we should construct *actually* even a small part of mathematics consistently. The deductions in this Part (III) will serve as preparation for this purpose. Another purpose of this Part (III) is to show some examples and the elegance of the actual deductions in UL.⁶⁾

$$\iota * 19 \quad (\sigma \circ \iota) \uparrow a = \sigma \uparrow a$$

(Added in proof) (i) The principle of arranging the formulas in this Part (III) is as follows. The main symbols used are classified into seven groups: (i) $=$, \leq ; (ii) $\{a, b\}$, $\langle ab \rangle$; (iii) Un , Un_2 , D_σ , W_σ , a^σ , A^σ ; (iv) σ^{-1} ; (v) $\sigma \circ \tau$; (vi) \uparrow ; and (vii) \cdot . To these groups correspond respectively the seven Sections: $=$, El , Im , -1 , \circ , \uparrow , and \cdot . If, among the symbols listed above and contained in a formula A to be proved, x is the symbol which belongs to the rightmost group, say y , then A is proved in the Section corresponding to the group y . Owing to this principle it happens that in the proof of $-1*12$ are used some cuts of which the cut formulas are proved after $-1*12$.

(ii) Most proofs are analytic (see the last page of Part (IV)). For instance, the proofs for $-1*12$, $\cdot * 18$, $-1*14$, $\uparrow * 10$, etc. are not analytic: note that in the proofs of $\uparrow * 10$ is found the dependent variable $\langle rr' \rangle$ and in that of $-1*14$ the variables $a^{\sigma^{-1}(\sigma^{-1})^{-1}}$ and $W_{\sigma^{-1}}$, which do not belong to the closure of the variables in the formulas to be proved. Some formulas with non-analytic proofs may be proved analytically.

(iii) All the proofs are given in the reduced form (see § 20, Part (II)), or in the normal form except some practical change. The weakly irreducible proofs are those for $*El*6$, $*El*7$; and for $*\uparrow*1$, $*\uparrow*4$, $*\uparrow*5$, $*\uparrow*6$ and $*\cdot*6$. Thus, the proofs are given without roundabout way and without superfluity as far as we can.
